

Certificate of Analysis

Standard Reference Material® 1830

Soda-Lime Float Glass (Nominal Mass Fraction 0.1 % Al₂O₃)

This Standard Reference Material (SRM) is intended for use in checking chemical methods of analysis and in calibrating instrumental methods of analysis. A unit of SRM 1830 consists of three platelets each measuring 38 mm square. The certified values are listed in Table 1 and represent the present best estimate of the “true value” based on the results of the cooperative program for certification. All values are reported as mass fractions [1].

The uncertainties listed are expressed as “combined uncertainties” calculated according to the JCGM and NIST Guides [2]. Each uncertainty is based on the 95 % confidence limit of the “true value”, and is intended to represent the combined effect of uncertainty components associated with various analytical factors such as method imprecision, possible systematic errors among methods, and material variability. The measurand is the total mass fraction of each constituent listed in Table 1, and the certified value is metrologically traceable to the SI-derived unit for mass fraction, expressed as percent.

Table 1. Certified Mass Fractions

Constituent	Mass Fraction (%)		
SiO ₂	73.07 ^(a,l)	±	0.04
Na ₂ O	13.75 ^(a,m,c,f)	±	0.06
CaO	8.56 ^(a,m,g,k)	±	0.06
MgO	3.90 ^(a,m,i,k)	±	0.04
SO ₃	0.26 ^(a,b)	±	0.01
Al ₂ O ₃	0.12 ^(a,m,c,d,j)	±	0.02
Fe ₂ O ₃ (total iron as)	0.121 ^(a,m,h)	±	0.003
FeO	0.032 ^(a)	±	0.004
K ₂ O	0.04 ^(a,c,m,e)	±	0.01
TiO ₂	0.011 ^(a,d,h)	±	0.001

Methods Used: The primary procedures used in the analysis of this SRM are those recommended for referee analysis in ASTM C 169 Standard Methods for Chemical Analysis of Soda-Lime and Borosilicate Glass. All methods used in the certification of SRM 1830 are cited in Table 1.

^(a)ASTM C 169 referee analysis

^(b)Combustion

^(c)Flame Emission

^(d)Spectrophotometry

^(e)Butyl Alcohol, HClO₄

^(f)Magnesium Uranyl Acetate

^(g)KMnO₄ Titration

^(h)X-ray Fluorescence

⁽ⁱ⁾Gravimetric (8-Hydroxyquinoline)

^(j)Gravimetric (Single Precipitation)

^(k)Complexometric

^(l)Gravimetric (Single-Dehydration)

^(m)Atomic Absorption

⁽ⁿ⁾Gravimetric (Double Precipitate)

Expiration of Certification: The certification of **SRM 1830** is valid indefinitely, within the measurement uncertainty specified, provided the SRM is handled and stored in accordance with instructions given in this certificate (see “Instructions for Use”). Accordingly, periodic recertification of this SRM is not required. However, the certification is nullified if the SRM is damaged, contaminated, or otherwise modified.

Technical and support aspects involved in the original preparation, certification, and issuance of this SRM were coordinated through the Standard Reference Materials Program by W.P. Reed and R.K. Kirby.

Carlos A. Gonzalez, Chief
Chemical Sciences Division

Gaithersburg, MD 20899
Certificate Issue Date: 12 July 2017

Steven J. Choquette, Director
Office of Reference Materials

Support aspects involved in the issuance of this SRM were coordinated through the NIST Office of Reference Materials.

Maintenance of SRM Certification: NIST will monitor this SRM over the period of its certification. If substantive technical changes occur that affect the certification, NIST will notify the purchaser. Registration (see attached sheet or register online) will facilitate notification.

INSTRUCTIONS FOR USE

CAUTION: (1) Before using the SRM in checking chemical analysis, it must be ground in agate to –200 mesh. (2) Before measuring with X-ray fluorescence, at least 30 µm of the surface should be removed by polishing because this glass was made by a float process and may have a thin film of tin on one surface.

Homogeneity⁽¹⁾: This material was tested for homogeneity at NIST by P.A Pella and R.L. Myklebust of the NIST division formally known as Analytical Chemistry Division using X-ray fluorescence spectrometry. Three to five replicate measurements were made on at least 10 elements in each of 15 samples chosen at random from the lot of material. The results did not indicate any significant difference between the samples (for instance, the relative standard deviation for calcium was found to be less than 0.1 %) other than that caused by the thin film of tin.

The material for this SRM was prepared and furnished to NIST by Libbey-Owens-Ford Company, Toledo, OH.

Development of this SRM is part of the program of ASTM Subcommittee C14.91 on Standard Reference Materials, H.E. Hagy, Chairman. The overall direction and coordination of the cooperative analyses leading to certification originally and in revision to include iron oxide were performed by G.D. Bowling, Chairman of ASTM Subcommittee C14.02 on Chemical Properties and Analysis of Glass and Glass Products.

Cooperative analyses for certification were performed in the following laboratories:

Anchor Hocking Corp., Lancaster, OH
Broadway Glass Co., Inc., Brockway, PA
Corning Glass Works, Corning, NY
Emhart Industries, Inc., Windsor, CT
Ford Motor Co., Lincoln Park, MI
Libbey-Owens-Ford Co., Toledo, OH

Monarch Analytical Laboratories, Inc., Toledo, OH
Owens-Corning Fiberglass Corp., Granville, OH
Owens-Illinois, Inc., Toledo, OH and Vineland, NJ
Pennsylvania State University, University Park, PA
Schott Glass Technologies, Inc., Duryea, PA
Sharp-Schurtz Co., Lancaster, PA
Thatcher Glass Co., Elmira, NY
