Standard Reference Material® 4416L

Gallium-67 Radioactivity Standard

Lot Number 38

Ampoule 3

This Standard Reference Material (SRM) consists of a solution of a standardized and certified quantity of radioactive gallium-67 in a suitably stable and homogeneous matrix. It is intended primarily for the calibration of instruments that are used to measure radioactivity and for the monitoring of radiochemical procedures. A unit of SRM 4416L consists of approximately 5 mL of a solution, whose composition is specified in Tables 1 and 2, contained in a flame-sealed borosilicate-glass ampoule [1].

The certified **gallium-67** massic activity value, at a **Reference Time of 1200 EST, 23 May 2017**, is:

$(3.288 \pm 0.032) \text{ MBq}\cdot\text{g}^{-1}$

A NIST certified value, as used within the context of this certificate, is a value for which NIST has the highest confidence in its uncertainty assessment. It is a “measurement result” [2] obtained directly or indirectly from a “primary reference measurement procedure” [3]. The certified value is traceable to the derived SI unit, the becquerel (Bq).

Additional physical, chemical, and radiological properties for this SRM, as well as details on the standardization method, are given in Tables 1 and 2. Uncertainties for the certified quantities are expanded ($k = 2$). The uncertainties are calculated according to the ISO and NIST Guides [4,5]. Table 3 contains a specification of the components that comprise the uncertainty analyses.

Expiration of Certification: The certification of **SRM 4416L** is valid, within the measurement uncertainty specified, within its half-life-dependent useful lifetime, provided the SRM is handled in accordance with instructions given in this certificate (see “Instructions for Handling and Storage”). The certification is nullified if the SRM is damaged, contaminated, or otherwise modified.

Maintenance of Certification: NIST will monitor this SRM over the period of its certification. If substantive technical changes occur that affect the certification, NIST will notify the purchaser.

Radiological and Chemical Hazard: Consult the Safety Data Sheet (SDS), enclosed with the SRM shipment, for radiological and chemical hazard information.

This SRM was prepared in the Physical Measurement Laboratory, Radiation Physics Division, Radioactivity Group, M.P. Unterweger, Group Leader. The overall production, technical direction and physical measurement leading to certification were provided by W. Regits and K.A. Neal, Guest Researchers from NRMAP, Incorporated.

Support aspects involved in the issuance of this SRM were coordinated through the NIST Measurement Services Division.

July 2017

Table 1. Certified Massic Activity of SRM 4416L, Lot 38, Ampoule 3

Radionuclide	Gallium-67
Reference time	1200 EST, 23 May 2017
Massic activity of the solution	3.288 MBq•g⁻¹
Relative expanded uncertainty ($k = 2$)	0.98 %^(a)

^(a)The uncertainties on certified values are expanded uncertainties, $U = ku_c$. The quantity u_c is the combined standard uncertainty calculated according to the ISO and NIST Guides [4,5]. The combined standard uncertainty is multiplied by a coverage factor of $k = 2$ and was chosen to obtain an approximate 95 % level of confidence.

Table 2. Uncertified Information of SRM 4416L, Lot 38, Ampoule 3

Source description	Liquid in a flame-sealed 5-mL NIST borosilicate ampoule [1]
Solution composition	2 mol•L ⁻¹ HCl with 78 µg Ga ⁺³ per gram of solution (as GaCl ₃)
Solution density	(1.031 ± 0.002) g•mL ⁻¹ at 20.0 °C ^(a)
Solution mass	(5.1570 ± 0.0003) g ^(a)
Photon-emitting impurities	None detected ^(b)
Half life used	⁶⁷ Ga: (3.2613 ± 0.0005) d ^(c)
Calibration method (and instruments)	Measurements of ionization current ratios relative to radium-226 reference sources using NIST pressurized "4π"γ ionization chamber "B" calibrated with a gallium-67 solution whose activity was determined by 4π(e+X)-γ-anti-coincidence efficiency-extrapolation technique, using liquid scintillation for the e+X detection and NaI for the γ-ray detection, with confirmatory measurements by 4πγ(NaI) integral counting

^(a)The stated uncertainty is two times the standard uncertainty.

^(b)The estimated lower limits of detection for photon-emitting impurities, expressed as massic photon emission rates, as of 24 May 2017 were:

- 1.6 × 10³ s⁻¹•g⁻¹ for energies between 35 keV and 40 keV,
- 7.4 × 10² s⁻¹•g⁻¹ for energies between 45 keV and 110 keV,
- 3.5 × 10² s⁻¹•g⁻¹ for energies between 115 keV and 165 keV,
- 6.1 × 10² s⁻¹•g⁻¹ for energies between 170 keV and 200 keV,
- 2.4 × 10² s⁻¹•g⁻¹ for energies between 205 keV and 280 keV,
- 5.7 × 10² s⁻¹•g⁻¹ for energies between 285 keV and 310 keV,
- 1.0 × 10² s⁻¹•g⁻¹ for energies between 320 keV and 370 keV,
- 3.3 × 10² s⁻¹•g⁻¹ for energies between 380 keV and 410 keV,
- 4.6 × 10¹ s⁻¹•g⁻¹ for energies between 420 keV and 810 keV,
- 2.1 × 10¹ s⁻¹•g⁻¹ for energies between 820 keV and 860 keV,
- 8.2 × 10¹ s⁻¹•g⁻¹ for energies between 870 keV and 900 keV, and
- 1.6 × 10¹ s⁻¹•g⁻¹ for energies between 910 keV and 2000 keV,

provided that any impurity photons are separated by four keV or more from photons emitted in the decay of gallium-67.

^(c)The stated uncertainty is the standard uncertainty. See reference 6.

Table 3. Uncertainty Evaluation for the Massic Activity of SRM 4416L, Lot 38

	Uncertainty component	Assessment Type ^(a)	Relative standard uncertainty contribution on massic activity of gallium-67 (%)
1	Ionization-chamber measurement precision for the low-level solution (SRM 4416L, Lot 38); standard deviation of the mean for five sets of measurements on ten ampoules	A	0.07
2	"4π"γ ionization-chamber calibration factor	B	0.47
3	Effect of carrier concentration and density changes on ionization-chamber response	B	0.04
4	Decay correction for radium-226 reference source to correct the calibration factor (for half-life uncertainty of 0.44 %)	B	0.001
5	Radium reference source positioning	B	0.05
6	Radium-226 reference source ratio	B	0.04
7	Electrometer response linearity	B	0.10
8	Gravimetric mass measurements	B	0.05
9	Decay correction for gallium-67 (for half-life uncertainty of 0.015 %)	B	0.00003
10	Detection limits for photon-emitting impurities	B	0.005
Relative combined standard uncertainty			0.49
Relative expanded uncertainty (<i>k</i> = 2)			0.98

^(a)Type A denotes evaluation by statistical methods; Type B denotes evaluation by other methods.

INSTRUCTIONS FOR HANDLING AND STORAGE

Handling: If the ampoule is transported, it should be packed, marked, labeled, and shipped in accordance with the applicable national, international, and carrier regulations. The solution in the ampoule is a dangerous good (hazardous material) because of both the radioactivity and the strong acid. The ampoule should be opened only by persons qualified to handle both radioactive material and alkaline and/or acidic solutions. Appropriate shielding and/or distance should be used to minimize personnel exposure. Refer to the SDS for further information.

Storage: SRM 4416L should be stored and used at a temperature between 5 °C and 65 °C. The ampoule (or any subsequent container) should always be clearly marked as containing radioactive material.
